Personal Notes

These notes are a concise collection of derived problems inspired by the examples from the Calculus books by Marsden and Weinstein.

Chapter names in these notes follows the chapter headings in the book.

1 Derivatives and Limits

1.1 Reading Limits from a Graph

From the graph of $y = h(x)$ below, find $\lim_{x \rightarrow a} h(x)$, if it exists, for

$$a = 1, 2, 3, 4, 5.$$

Also state $h(a)$ whenever it is defined.

Answer

From the graph we read:

$$\lim_{x \rightarrow 1} h(x) = 0.5$$

since the graph is continuous there.

$$\lim_{x \rightarrow 2} h(x) = 1$$

even though

$$h(2) = 1.5.$$

At $x = 3$, the left-hand limit is 0.5 while the right-hand limit is 1.2, so

$$\lim_{x \rightarrow 3} h(x)$$

does not exist.

At $x = 4$, the graph approaches 1 from both sides, so

$$\lim_{x \rightarrow 4} h(x) = 1,$$

but $h(4)$ is not defined.

As x approaches 5, the function grows without bound, so

$$\lim_{x \rightarrow 5} h(x)$$

does not exist as a finite number.

1.2 Find $\lim_{x \rightarrow 0} \frac{|x|}{x}$

Answer

This is better visually but we can see that for $x > 0$ the function is 1 and for $x < 0$ the function is -1, and at $x = 0$ the denominator is 0 and the function is undefined at that point. Therefore the limit does not exist at 0.

1.3 Find $\lim_{x \rightarrow \infty} \frac{1}{x}$

Answer

This will be simply 0, since denominator tends to ∞ and the resultant fraction will tend to 0.

1.4 Find $\lim_{x \rightarrow \infty} \frac{7x - 2}{11x + 9}$

Answer

$$\lim_{x \rightarrow \infty} \frac{7x - 2}{11x + 9} = \lim_{x \rightarrow \infty} \frac{7 - 2/x}{11 + 9/x} = \frac{7}{11}$$

1.5 Find $\lim_{x \rightarrow -\infty} \frac{4x^2 - 5x + 3}{x^2 + 2}$

Answer

$$\lim_{x \rightarrow -\infty} \frac{4x^2 - 5x + 3}{x^2 + 2} = \lim_{x \rightarrow -\infty} \frac{4 - 5/x + 3/x^2}{1 + 2/x^2} = 4$$

1.6 Find $\lim_{x \rightarrow 3} \frac{-5x}{x^2 - 6x + 9}$

Answer

$$\lim_{x \rightarrow 3} \frac{-5x}{x^2 - 6x + 9} = \lim_{x \rightarrow 3} \frac{-5x}{(x - 3)^2} = -\infty$$

As x reaches 3, the numerator tends to -15 and the denominator is very small. So at $x = 3$ we get a very large value which is negative ∞ . Something like below. Ideally I should plot these in Python but I am using LLMs to generate tikz figures quickly. So please verify real plots when we have to truly plot graphs.

1.7 Find $\lim_{x \rightarrow 0} \frac{5x + 3}{x}$

Answer

$$\lim_{x \rightarrow 0} \frac{5x + 3}{x} = \lim_{x \rightarrow 0} 5 + \frac{3}{x}$$

As $x \rightarrow 0$ from the positive side of x the value of $\frac{3}{x}$ becomes very large towards $+\infty$. Similarly from the negative side of x the value becomes $-\infty$. Thus limit actually does not exist. If we were computing one sided limits we could get the values. The graph shows the curve.

1.8 Compute $(1.05)^2$

Answer

Linear approximation formula (check derivation)

$$f(x_0 + \Delta x) \approx f(x_0) + f'(x_0)\Delta x$$

Consider $f(x) = x^2$

$$\approx 1^2 + 2 \times 1 \times 0.05 = 1.10$$

1.9 Compute $\sqrt{256.016}$

Answer

$$f(x) = \sqrt{x}$$

$$\approx \sqrt{256} + \frac{1 \times 0.16}{2 \times \sqrt{256}} = 16 + \frac{16 \times 10^{-3}}{2 \times 16} = 16.0005$$

1.10 Compute $\frac{2}{\sqrt{0.99} + 0.99^2 + 0.99}$

Answer

$$f(x) = \frac{2}{\sqrt{x} + x^2 + x} \text{ and } x = 1, \Delta x = -0.01$$

$$\approx \frac{2}{\sqrt{1} + 1^2 + 1} - \frac{2 \times \frac{7}{2}}{9} \times (-0.01) = \frac{6.07}{9} = 0.674$$
